

# Management of MMTx Data

## General Approach

**Rationale.** The current practice is to keep all of the MMTx data in /net/skr1/ssa2/MMTx\_build/mmtxData. From here the directory is referenced from development workspaces and copied into builds. This location is the repository for all data supplied with MMTx. One of the consequences is that we are distributing unused files. There are also some advantages to configuration that will be mentioned below.

### Suggested Approach.

- Extremely large files of data usually maintained as tar-ed and g-zipped archives remain outside of CVS.
- Files on which modules depend should be under configuration management.
- A separate CVS repository will be used for this data. This allows a checkout of the entire project repository for

## Deployed Location

When a basic installation or an installation with sources is completed, the \$MMTX directory will contain a data directory with the following contents:

```
mmtx/data/  
  01/  
    lexicon/  
      fullVars.txt  
      infl.txt  
    mmtx/  
      semdef.txt  
      treecodes.txt  
    strict/  
      allwords.txt ...  
  01_MMTxDBTest/ ...  
  dfbuilder/  
    OSuppress1  
    infl.txt  
    MRCON.mesh  
    st.raw  
    semdef.txt
```
